

I am one of millions of new HDTV capable television owners who are now, or soon will be very frustrated over HDCP (High-bandwidth Digital Content Protection). The reason for this is that all the new HD set top boxes (I'm eyeballing a Samsung DVD player as well as Dish Network's new HDTV PVR) will ONLY send HD signals via a DVI connector. My new HDTV does not have one, rather it only has the component video connectors that are more than capable of transmitting 720p and 1080i signals to my screen, but the HDCP ruling makes it illegal to create a converter from DVI to component video so I can enjoy it. This ruling must be reversed and converters must be made available to the public who are paying for all this stuff!

Thank you,
Warren Sever
